

**In the Claims:**

1. (Previously presented) A resistor network such as a resistor ladder network, comprising a resistor body that includes multiple resistor sub-bodies, and a plurality of columns of taps, each of the resistor sub-bodies situated between two of the columns of taps and connected to each of the taps of the two columns of taps, wherein at least two of the taps are configured to be connected with respective first and second sources of reference input potentials, and wherein each tap of the columns of taps is configured for outputting an output potential via a contact area which is connected with the concerning tap, and wherein the only electrical connections between the resistor sub-bodies are electrical connections via the taps connected with the resistor sub-bodies.
2. (Previously presented) A resistor network according to claim 1, wherein each tap of the columns of taps is a T-shaped or S-shaped projection which is connected with one of the resistor sub-bodies.
3. (Previously Presented) A resistor network according to claim 1, characterised in that, a plurality of taps of a first column of taps of a first resistor sub-body is connected with a plurality of taps of a second column of taps of a second resistor sub-body, wherein each tap of the plurality of taps of the first column is connected with only one tap of the plurality of taps of the second column and wherein each tap of the plurality of taps of the second column is connected with only one tap of the plurality of taps of the first column.
4. (Previously Presented) A resistor network according to claim 3, characterised in that, each tap of the first column is shifted at least one column position with respect to the column position of the tap of the second column with which the tap of the first column is connected.
5. (Previously Presented) A resistor network according to claim 3, characterised in that, the respective connections between the resistor sub-bodies with the taps are made during

fabrication of the resistor network at different arbitrary positions with respect to the respective taps.

6. (Previously Presented) A resistor network according to claim 1, characterised in that, the resistor network is a semiconductor circuit, wherein each resistor sub-body comprises a number of resistor layers, wherein each semi-conducting resistor layer comprises at least two taps, and wherein the semi-conducting resistor layers are interconnected via the taps.

7. (Currently Amended) An Analog-Digital converter for generating a digital output signal on the basis of an analog input signal, characterised in that, the Analog-Digital converter comprises a resistor network ~~according to claim 1~~ having  
a resistor body that includes multiple resistor sub-bodies, and  
a plurality of columns of taps, each of the resistor sub-bodies situated between  
two of the columns of taps and connected to each of the taps of the two columns of taps,  
wherein at least two of the taps are configured to be connected with respective  
first and second sources of reference input potentials,  
wherein each tap of the columns of taps is configured for outputting an output  
potential via a contact area which is connected with the concerning tap, and  
wherein the only electrical connections between the resistor sub-bodies are  
electrical connections via the taps connected with the resistor sub-bodies.

8. (Currently Amended) A Digital-Analog converter for generating an analog output signal on the basis of a digital input signal, characterised in that, the Digital-Analog converter comprises a resistor network ~~according to claim 1~~ having  
a resistor body that includes multiple resistor sub-bodies, and  
a plurality of columns of taps, each of the resistor sub-bodies situated between  
two of the columns of taps and connected to each of the taps of the two columns of taps,  
wherein at least two of the taps are configured to be connected with respective  
first and second sources of reference input potentials,

wherein each tap of the columns of taps is configured for outputting an output potential via a contact area which is connected with the concerning tap, and  
wherein the only electrical connections between the resistor sub-bodies are electrical connections via the taps connected with the resistor sub-bodies.

9. (Cancelled)

10. (Cancelled)

11. (Cancelled)

12. (Previously presented) A resistor ladder network, comprising:

a resistor body that includes multiple resistor sub-bodies; and  
a plurality of columns of taps, each of the resistor sub-bodies situated between two of the columns of taps and connected to each of the taps of the two columns of taps, the columns of taps arranged in parallel to and alternating with the resistor sub-bodies, wherein at least two of the taps are configured to be connected with respective first and second sources of reference input potentials, each tap of the columns of taps is configured for outputting an output potential via a contact area which is connected with the concerning tap, and the only electrical connections between the resistor sub-bodies are electrical connections via the taps connected to the resistor sub-bodies.

13. (Previously presented) A resistor ladder network according to claim 12, wherein each tap of the columns of taps is a T-shaped or S-shaped projection which is connected with one of the resistor sub-bodies and each of the columns of taps includes at least three taps.

14. (Previously presented) A resistor ladder network according to claim 12, wherein a plurality of taps of a first one of the columns of taps connected to a first one of the resistor sub-bodies is connected with a plurality of taps of a second one of the columns of taps connected to a second one of the resistor sub-bodies, each tap of the first column connected with only one of the taps of the second column.

15. (Previously presented) A resistor ladder network according to claim 14, wherein each tap of the first column is shifted at least one column position with respect to a column position of the tap of the second column with which the tap of the first column is connected.

16. (New) A resistor network according to claim 1, wherein each of the taps is connected to at most two resistor sub-bodies, and wherein each resistor sub-body is connected to a plurality of taps.
